If the score predicted by NN-based method is greater than or equal to the score predicted by Logistic-based method, then that model is assigned as "pass". Otherwise, that model is assigned as "fail". A model is classified as pass if at least 20% of images that model is predicted as pass. Otherwise, it is classified as fail. The classifier is run 10 times with different training sets and the classification results are shown in [Table 1](#tbl01){ref-type="table"}. To evaluate the performance of our classifier on a larger scale, we have carried out a rigorous experiment. The positive and negative training sets were extracted from the data sets included in the AutoLesion5.1 challenge, where the majority of the positive images are unseen during the training process. The confusion matrix ([Table 2](#tbl02){ref-type="table"}) shows the prediction results for a test image from the AutoLesion5.1 data set. [Figure 2](#fig02){ref-type="fig"} shows examples of the positive images, where the models predict the lesion and negative images, where they do not.
